- 2. RISC-V-based SoC
- 3. TLS 1.3 Cryptographic Accelerators
- 4. Experimental Result
- 5. Conclusion

Introduction (1/2)

Transport Layer Security (TLS)

- The successor of Secure Sockets Layer (SSL)
- Among the most commonly used security protocols over the Internet
- The latest proposal is v1.3 [1] (2018)
- Is equipped with many current robust cryptography algorithms

• TLS 1.3 workflow is not fixed yet; many cryptographic functions are left as optional

This work aiming for developing TLS-1.3-oriented cryptographic accelerators for RISC-V System-on-Chip (SoC)

Introduction (2/2)

List of supported algorithms used in TLS-1.3

Both Server and Client

- 1. Key exchange:
 - · Supported groups:
 - Elliptic Curve Groups (ECDHE):
 - secp256r1(0x0017) (mandatory)
 - secp384r1(0x0018)
 - secp521r1(0x0019)
 - x25519(0x001D) (should)
 - x448(0x001E)
 - Finite Field Groups (DHE)
 - ffdhe2048(0x0100)
 - ffdhe3072(0x0101)
 - ffdhe4096(0x0102)
 - ffdhe6144(0x0103)
 - ffdhe8192(0x0104)
 - Task:
 - Generate private key
 - Generate public key
 - Create master key
- 2. HMAC based Key Derive Function (HKDF)
 - Supported digest function: SHA256/384
- 3. Cipher encryption and decryption:
 - · Cipher list:
 - AES-128-GCM (mandatory)
 - AES-256-GCM (should)
 - CHACHA20-POLY1305 (should)
 - AES-128-CCM
 - · AES-128-CCM-8

Server only

- 1. Signature algorithms
 - · Supported algorithm:
 - RSASSA-PKCS1-v1_5 algorithms
 - rsa_pkcs1_sha256(0x0401) (mandatory)
 - rsa_pkcs1_sha384(0x0501)
 - rsa_pkcs1_sha512(0x0601)
 - ECDSA algorithms
 - ecdsa secp256r1 sha256(0x0403) (mandatory)
 - ecdsa_secp384r1_sha384(0x0503)
 - ecdsa_secp521r1_sha512(0x0603)
 - RSASSA-PSS algorithms with public key OID rsaEncryption
 - rsa_pss_rsae_sha256(0x0804) (mandatory)
 - rsa_pss_rsae_sha384(0x0805)
 - rsa pss rsae sha512(0x0806)
 - EdDSA algorithms
 - ed25519(0x0807)
 - ed448(0x0808)
 - RSASSA-PSS algorithms with public key OID RSASSA-PSS
 - rsa_pss_pss_sha256(0x0809)
 - rsa_pss_pss_sha384(0x080a)
 - rsa pss pss sha512(0x080b)
 - Legacy algorithms
 - rsa_pkcs1_sha1(0x0201)
 - ecdsa_sha1(0x0203)
 - Task:
 - Create certificate
 - o Creage public and private key
 - o Sign certificate to create signature

Client only

- 1. Signature algorithms
 - · Supported algorithms:
 - Same as Server (does not have to support as many as the server does)
 - Task:
 - Verify signature

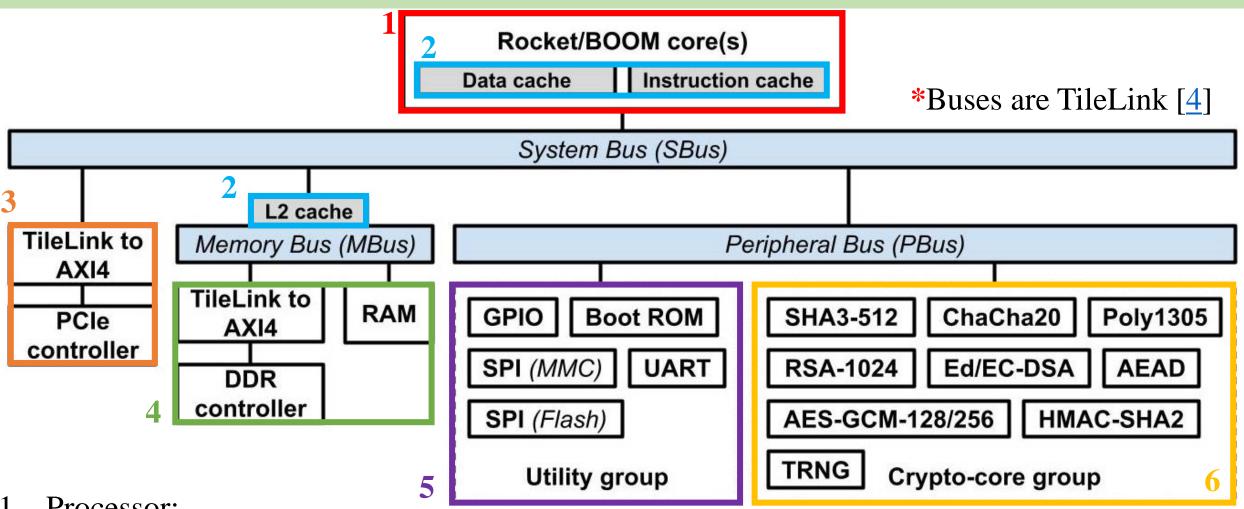

The key algorithms:

- ECDSA (*must*)
- Ed25519 (*should*)
- HMAC (*must*)
- AES-GCM (*must*)
- ChaCha-Poly (*should*)
- RSA (*must*)
- SHA2 (*must*)
- SHA3 (should)

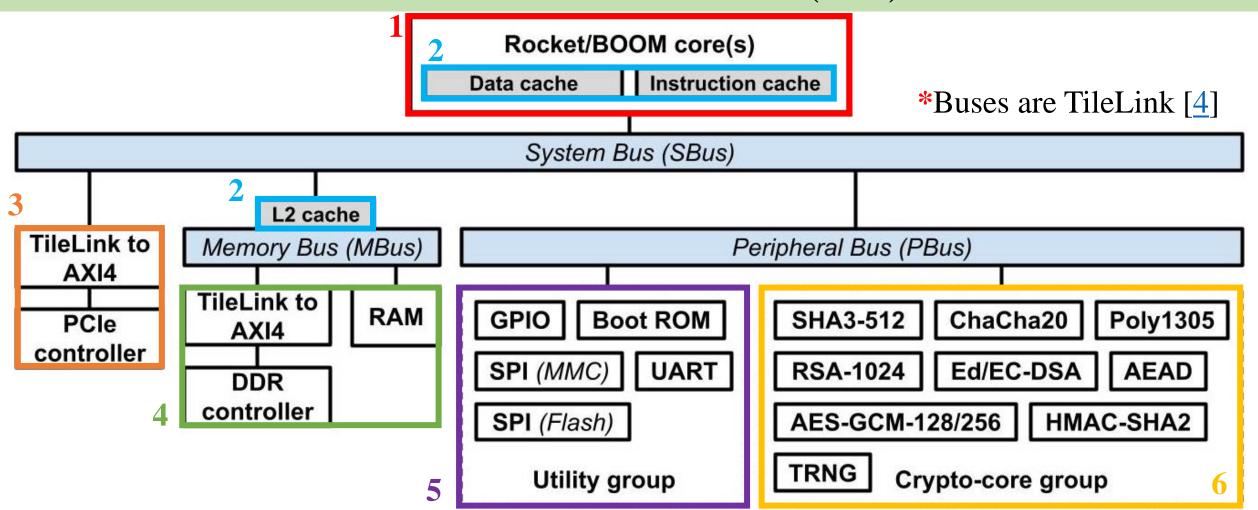

- 1. Introduction
- 2. RISC-V-based SoC
- 3. TLS 1.3 Cryptographic Accelerators
- 4. Experimental Result
- 5. Conclusion

RISC-V-based SoC (1/2)

- Processor:
 - Rocket [2] or BOOM [3]
 - RV64GC or RV32IMAC
 - Configurable number of cores
- Configurable caches sizes
- PCIe can be included/excluded
- 4. Can use on-chip RAM or off-chip DDR (or both)

RISC-V-based SoC (2/2)

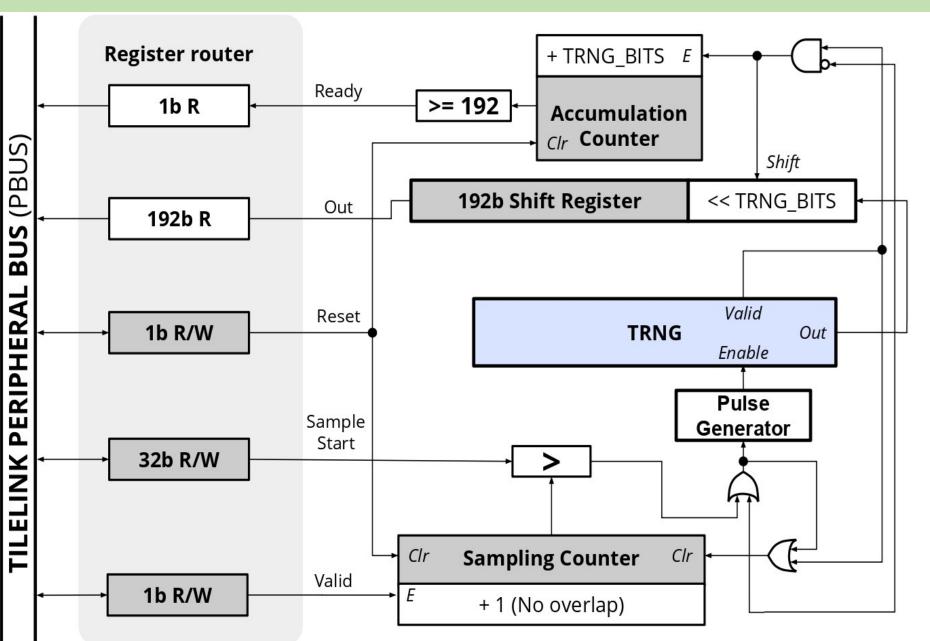

5. Boot ROM for ZSBL,
MMC for FSBL & linux image,
and UART for communication.

6. Each crypto-core is optional and can be included/excluded.

- 1. Introduction
- 2. RISC-V-based SoC
- 3. TLS 1.3 Cryptographic Accelerators
- 4. Experimental Result
- 5. Conclusion

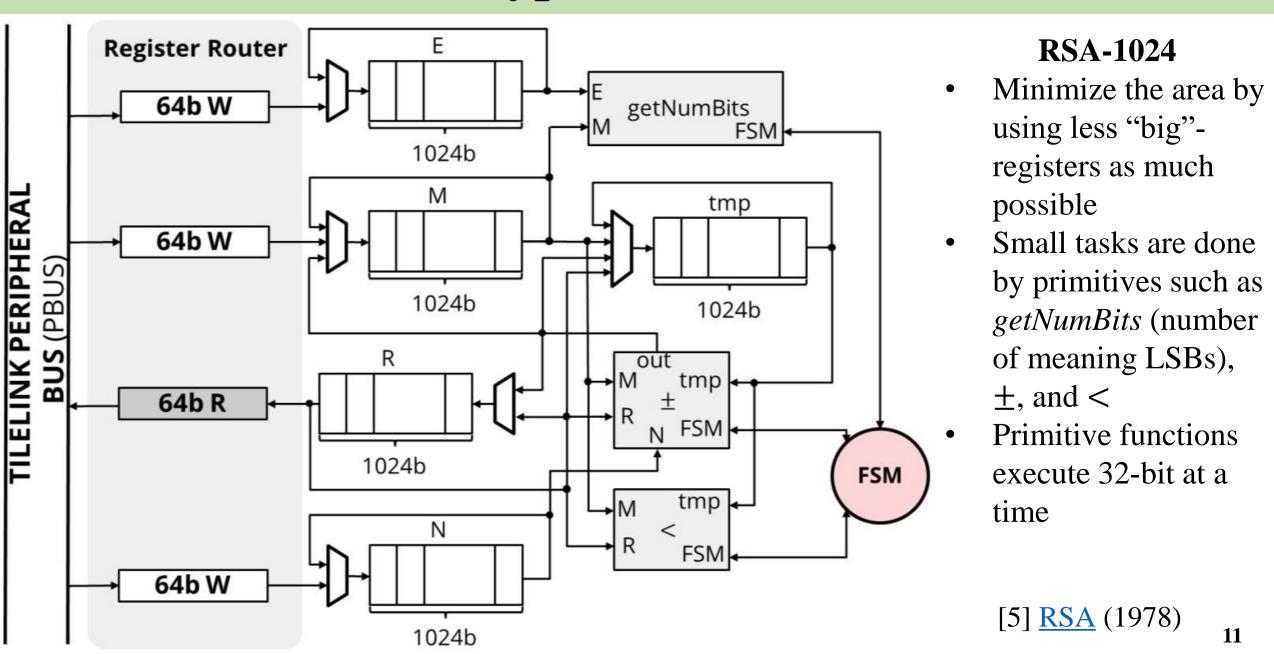

3. TLS 1.3 Crypto-core (1/9) TRNG

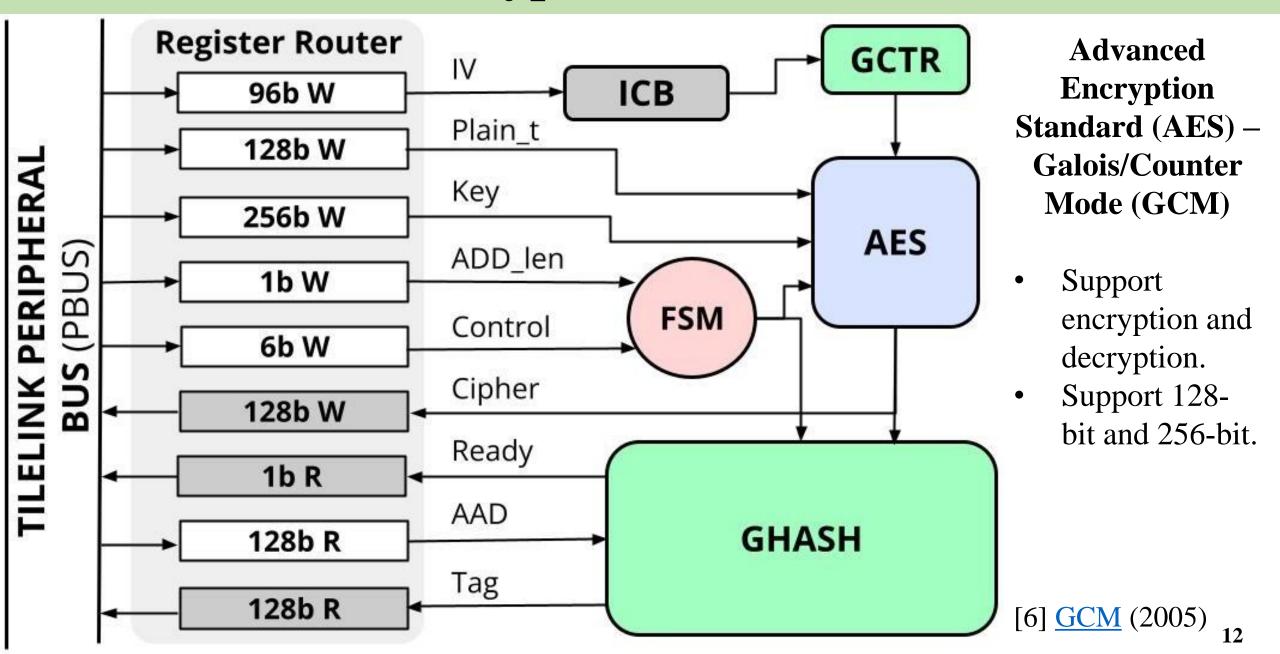

True Random Number Generator (TRNG)

- TRNG core is based on frequency collapse and ring oscillators.
- TRNG core passed NIST 800-22, 800-90B, and AIS31 tests.

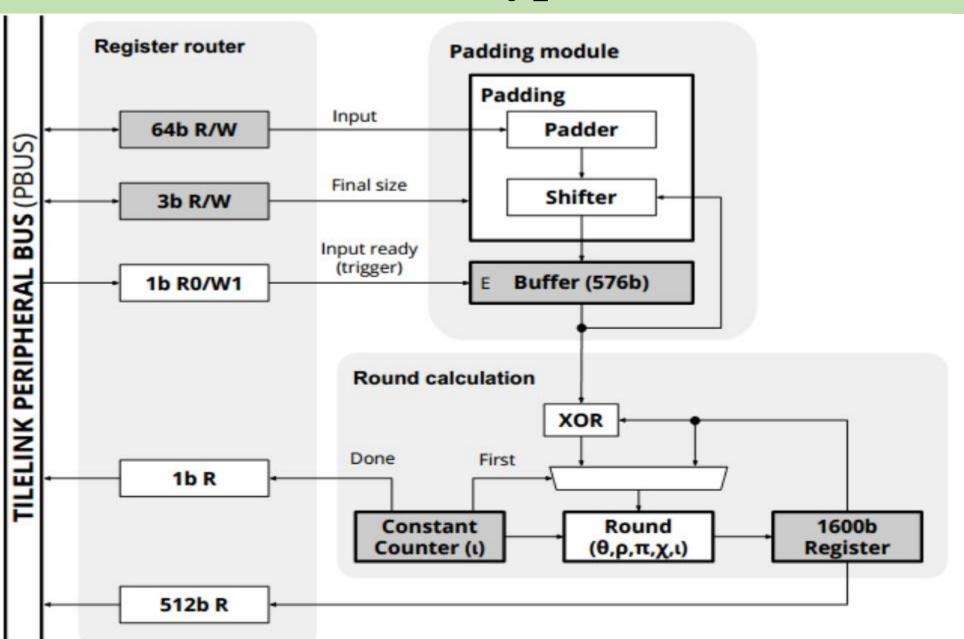

3. TLS 1.3 Crypto-core (2/9) RSA-1024

3. TLS 1.3 Crypto-core (3/9) AES-GCM

3. TLS 1.3 Crypto-core (4/9) SHA3-512

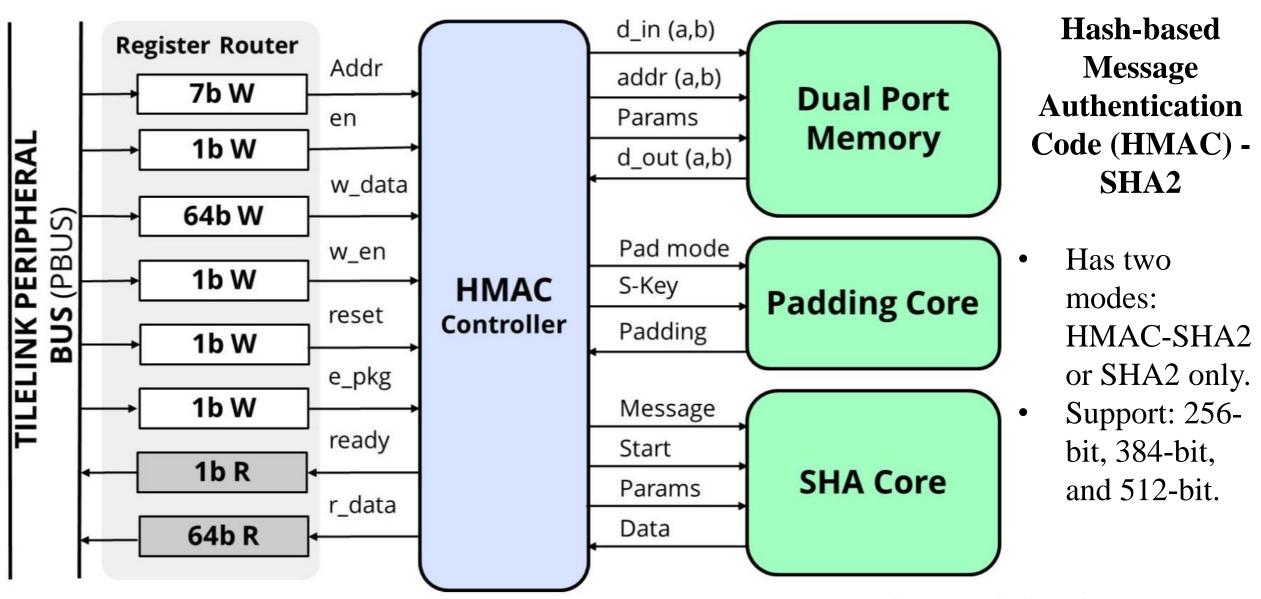

SHA3-512

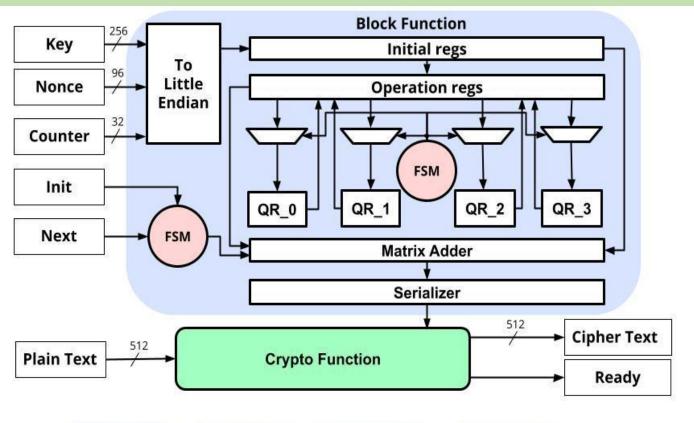

- Support 512-bit.
- The core was developed based on an opensource project [7] (2018).

[7] <u>SHA3</u> (2018)

3. TLS 1.3 Crypto-core (5/9) HMAC-SHA2

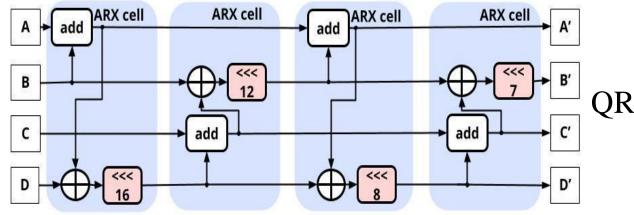

3. TLS 1.3 Crypto-core (6/9) ChaCha20

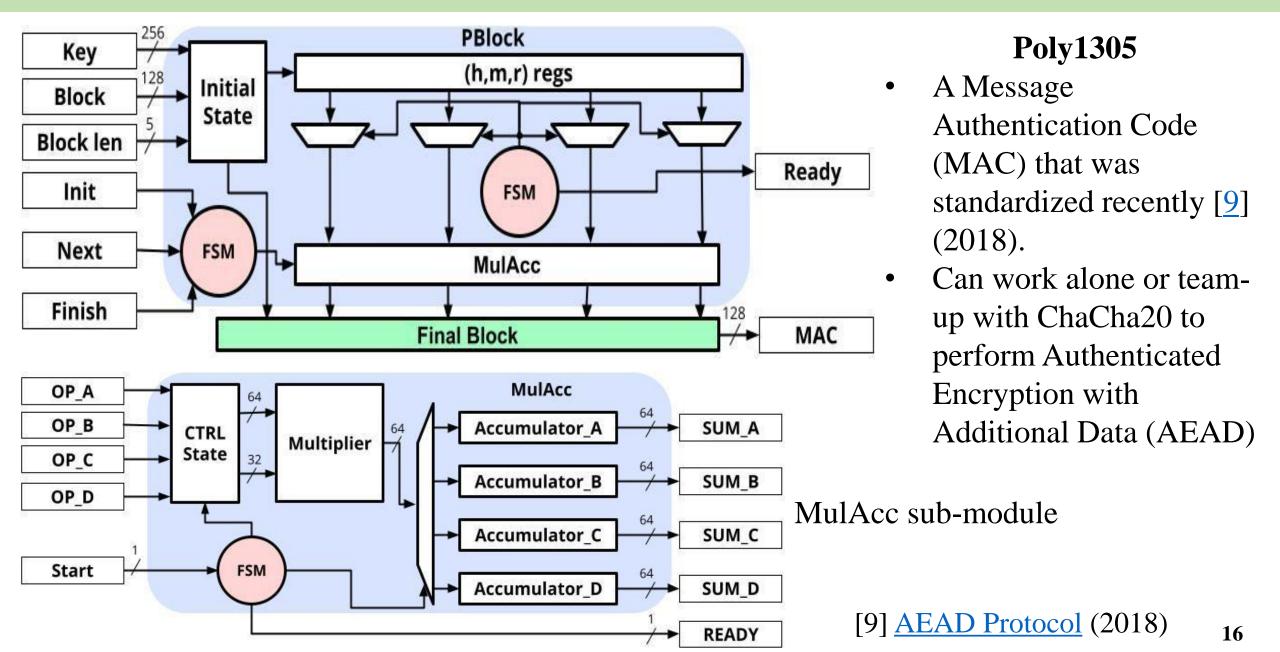

ChaCha20

- A stream cipher that was standardized recently [9] (2018).
- Can work alone or team-up with Poly1305 to perform Authenticated Encryption with Additional Data (AEAD)

QR sub-module

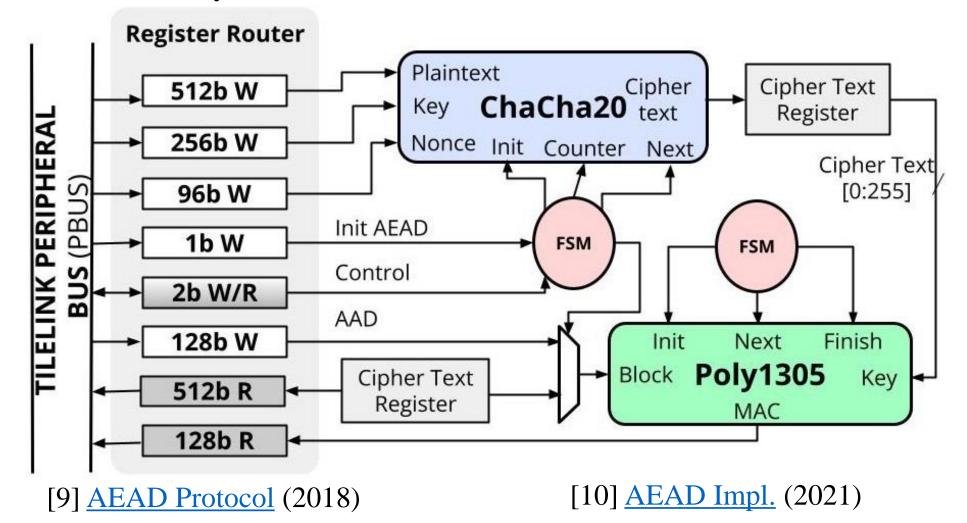

3. TLS 1.3 Crypto-core (7/9) Poly1305

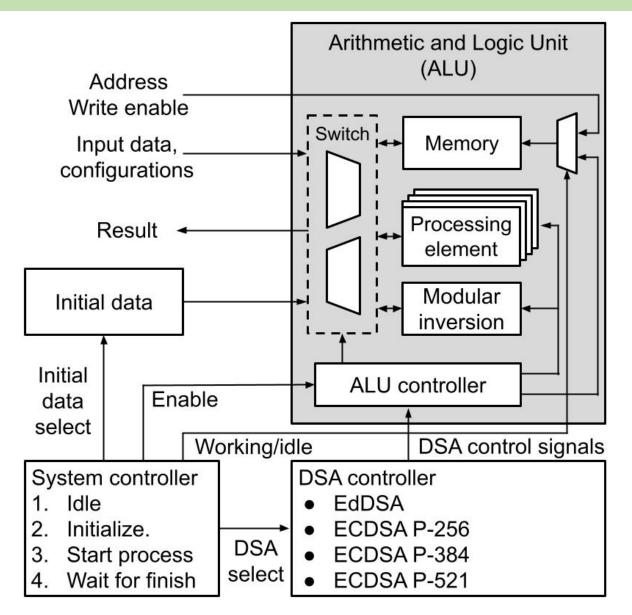

3. TLS 1.3 Crypto-core (8/9) AEAD

Authenticated Encryption with Associated Data (AEAD)

- Use ChaCha20 as a stream cipher and Poly1305 as a MAC.
- The ChaCha20 & Poly1305 cores are the same as mentioned earlier.

3. TLS 1.3 Crypto-core (9/9) EC/Ed-DSA

Ecliptic Curve (EC) + Edwards-curve (Ed) Digital Signature Algorithm (DSA)

- Support four curves: three of ECDSA and one of EdDSA
- Support 256-bit, 384-bit, and 512-bit
- Support functions: gen-key, sign, and verify

4. Experimental Result (4/9) ROHM180 synthesis

SoC resources utilization pie chart: All crypto-cores + Single-core RV32IMAC Rocket

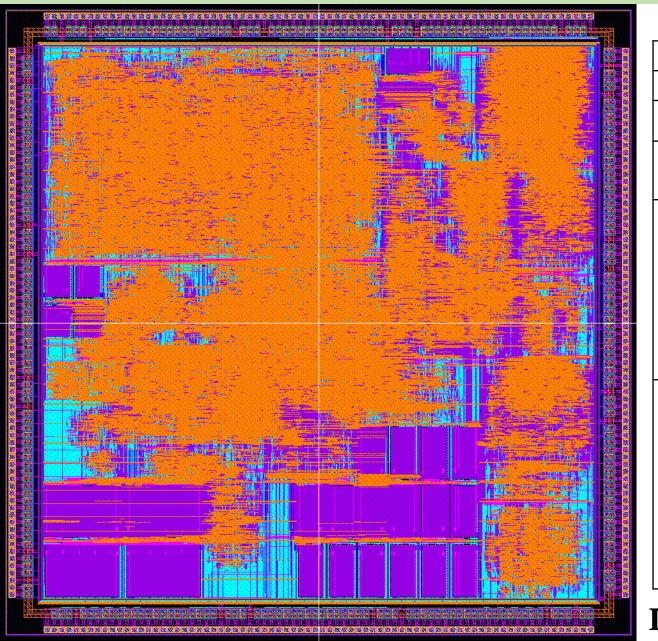

*Note: "the rest" means all the buses, TRNG, and utility-group peripherals such as GPIO, SPI, boot ROM, etc.

4. Experimental Result (5/9) ROHM180 chip

- One chip was fabricated in ROHM180 in Feb. 2022 (expected to be delivered in June 2022)
- Single-core Rocket with ISA of RV32IMAC
- All the crypto-cores for TLS-1.3 are included

4. Experimental Result (6/9) ROHM180 chip

Key features summarize

	Core		Rocket ×1		
	ISA		RV32IMAC		
Cache			I = 16KB and D = 16KB		
Crypto-cores: TRNG, RS			A, AES-GCM, SHA3, HMAC-		
SHA2, ChaCha20, Poly			1305, AEAD, & EC/Ed-DSA

- 1. Introduction
- 2. RISC-V-based SoC
- 3. TLS 1.3 Cryptographic Accelerators
- 4. Experimental Result
- 5. Conclusion

5. Conclusion (1/1)

- **RISC-V-based:** a complete SoC implementation aiming for TLS-1.3 was developed based on RISC-V architecture.
- TLS-1.3 Crypto-cores: a set of newly developed cryptographic accelerators were introduced, including TRNG, RSA-1024, AES-GCM, SHA3, HMAC-SHA2, ChaCha20, Poly1305, AEAD, and EC/Ed-DSA.
- **Flexibility & compact:** the whole SoC fitted nicely in a 5×5-mm² of ROHM180 chip. Many crypto-cores have multi-mode and multi-function such as HMAC-SHA2 and EC/Ed-DSA.
- The proposed SoC was **verified & tested** on both FPGA and VLSI implementations.

Thank You
